COMMANDO REFERENCE

Alpha-104 “Spider”

Usage

Commando Reference covers the Katarn Armor, DC-17M and DC-15s Sidearm. All other weapons will not be covered, please use the training server to explore the weapons provided. Commandos specialize in Close Quarters Fighting along with some long range capability, they are the bread and butter of urban fighting.

Equipment

- **Katarn Armor**

  The Katarn Armor has a couple options available to the user. From deflector shields that stop incoming damage to being a mobile mine dispenser. Here's a list.

Deflector Shield System	The Deflector Shield System is the shield that every commando is equipped with. They have a max charge of 100 and negate damage done to commandos when they are online. The charge for them can be seen on the Katarn status panel. Once the shields are hit, there is a 5 second cooldown before they begin charging again.
Intercom System	The helmet intercom system uses a short range frequency to relay communications that cannot be heard by those off of the intercom, or outside the squad. The intercom still allows for use of both short range, and long range radios, but disables the ability to speak in proximity while on. The intercom can be used in a squad wide channel, or can be used in two separate buddy channels. It also comes with volume controls. The intercom has a range of 200m.

Night Vision System	The NVG of a commando has four options. Base night vision controls offer basic night vision mode, white hot mode, and black hot mode. As commandos, we also have a Katarn system of Low Light Mode. This increases the lighting in dark environments and increases the light output seen from light sources.
ST-91 Wrist-Plate Stunner	The ST-91 is a stun device that is integrated directly into the wrist plate. It has an effective range of about 5m to the front and will temporarily incapacitate personnel that get hit. Using the Moktech Core keybinds is the best way to appropriately use this piece of equipment.
ST-92 Repulsor Blaster	The ST-92 is a variation of the ST-91 device that is integrated directly into the wrist plate. It has an effective range of about 5m to the front and will temporarily incapacitate personnel with heart beats that get hit. The main difference between this and the ST-91 is that it does not work on droids. Using the Moktech Core keybinds is the best way to appropriately use this piece of equipment.
Squad Shield (Medic Only)	The Medic's backpack has been equipped with three deployable Squad Shields. These can be activated using the corresponding self-interaction. The squad shield lasts 4 minutes and can effectively absorb a lot of incoming fire. It will not absorb heavy explosions
TRX-200 Integrated Mine Detection System (Demo Only)	The TRX-200 IMDS is a variant of the TRX-12 Mine Detection System. The notable differences are the increased range, removal of directional visuals, and it is directly attached to the armor instead of taking up an inventory slot. This piece of equipment isn't typically preferred as the removal of direction to the mine decreased the ability of the demolitionist to locate precise mines.
Mine Dispenser (Demo Only)	The Demolitionist's Backpack has been equipped with an integrated mine dispenser. The dispenser can be activated once, distributing mines behind the Commando in a 60° area.
Caltrop Dispenser (CQC Only)	The CQC Specialist's Backpack has been equipped with an integrated caltrop dispenser. The dispenser can be activated once, distributing non-lethal caltrops behind the Commando in a 60° area. These caltrops will cause victims to ragdoll and become temporarily incapacitated.

- **Katarn Wrist Blade**

  The Katarn Wrist Blade is a melee attachment for the Katarn armour. It allows Commandos to quickly dispatch enemies at close range. It is not effective on higher health contacts. It's pretty much an instant kill melee.

Weapons

DC-17M	60 Rounder Energy Cells	Normal firing method for the 17M, it's similar to the Westar in performance and Damage in this mode.
	5 Round Marksmen	5 rounds of higher powered energy shots. Typically these are saved for Statics such as Sniper Dekas and Particle Cannons. Best used in Single Fire mode
	1 Round Anti-Mat	An anti-vehicle shot that is explosive in nature, it does great impact damage but not much splash outside of the small radius. Its best use method is on Vehicles and Statics. 2 Shots will reliably blow up a Blue AAT, 1 shot will blow up a Deka, and ~6 will blow up a dispenser.
DC-15S Sidearm	7 Round Cell	The 15S has a 7 round cell that will begin regenerating ammo after 10 seconds of it last being fired. From the 10 Second marker it will regenerate 1 round per second till the Cell is fully charged again.
PLX	2 Round AT	The PLXs AT rounds are strong enough to One shot Blue AATs and 2 Shot Black AATs. They have 2 modes of fire and 2 shot types. The 2 modes are Top down or Direct, while the 2 types are Wire Guided and Lock-on
	3 Round AA	The PLX AA has one means of fire and can one shot disable HMPs outside the HMP-S. It can only be used in a Lock-On method.

Causality	60 Rounder Precision	Normal rounds fired out of the Causality. No HE splash, basically just the same as a DC-17M round.
	40 Round Normal	These rounds have a small HE effect to them that can splash enemies nearby. Not to be used near HVTs.
	1 Round Rail Shot	The Railshot is used to disable vehicle turrets for 10 seconds. This DOES NOT disable the vehicle's engine so it can still drive away.
E-403	5 Round AP	The E-403's AP shots are similar to an Anti-Mat, they do slightly less damage however have little to no drop. It's 2-3 Shots to destroy a Blue AAT.
	5 Round HE	The HE rounds have a decent sized splash, slightly larger than the 40mm HE. These rounds do have slight drop to them so keep that in mind.
