TECHNICIAN REFERENCE

Alpha-104 “Spider”

Usage

Technicians or Techs for short, rely on their vast arsenal of Hacks, Drones, and Equipment to deal untold levels of damage to enemies. They excel in Both Offensive and Defensive Tactics when used to their fullest.

Equipment

- **Prowler 500 (UAV)**

The Prowler-500 Recon Drone is a device used by recon & tech specialists to obtain an aerial view of a location from a distance to discover information more safely.

The drone must first be set up, then connected to a UAV terminal for use. The drone may be deployed and later repacked when not in use.

When in manual control, the Prowler-500 Recon Drone follows your chosen rotary control scheme.

The drone may also be automatically assigned. [Shift] + [Left Mouse Click] brings up autonomous movement controls, and [Control] + [Right Mouse Click] can be used to give multiple orders. [Right Mouse Click] on the arrow to define the different types of control.

Type: Drone movement orders

Behaviour: How the drone behaves

Altitude: What height the drone will move to

- **Mouse Droid (MSE-6)**

MSE-6 droids can be used for surveillance or for delivering a payload to an enemy target. To effectively use an MSE, the user will need all of the following pieces of equipment.

Droid Caller	The Droid caller is the piece of equipment required to activate and deactivate the MSE.
Maintenance Kit	The Maintenance kit is a piece of equipment that allows the user to remove the fuse and change the selected fuses.
MSE-6 Series Manual	The Operations Manual will appear next to the fuse panel to assist the user with their selections.

The MSE-6 has 4 Payload types, you can select from the following.

Safe	The MSE will not explode.
Random	The MSE will randomly select between EMP or EXPLOSIVE.
EMP	The MSE will release an EMP explosion.
Explosive	The MSE will release a normal explosion.

After the Payload type you have the Operation types.

Surveillance	The MSE will be used for recon, using only its driving functionalities.
Courier	The MSE will be used to deliver small objects, the user will be able to insert small items into the MSE
Demining	The MSE will be used to deliver an explosive payload, the user will be able to detonate the MSE on command

Following the Payload type you have the data protection mode. Basically you can choose between destruction on hit or destruction on immobilization.

On hit	If the MSE takes any amount of damage, the MSE will detonate.
On Immobilization	If the MSE becomes immobilized, the MSE will detonate.

Lastly you have the Side relations, before anything else make sure you have connected the Mouse Droid to your UAV terminal. Changing the MSEs Side to anything other than Blufor before connecting it to the terminal will lose your access to the droid.

RETAINER	The MSE will be on the side of the user.
OPFOR	The MSE will be on the OPFOR side.
BLUFOR	The MSE will be on the BLUFOR side.
INDEP	The MSE will be on the INDEP side.

- **Blaster Turret**

  The Blaster Turret is a placeable UAV that shoots at Opfor forces either independently or Manually. The Tech can connect to it and shoot Targets by using the UAV terminal to connect to it. Similar to connecting to a Prowler 500.

- **Auto Turret**

  Auto Turrets are a throwable grenade that once it lands deploys a small defense turret. It is connectable and requires no setup besides the grenade throw action. However, just like the Blaster Turret, it will automatically shoot at Opfor.

- **Datapad**

The Datapad is the Technicians bread and butter, the main function of this class is its wide variety of Hacks that the datapad allows you to perform. By default the Keybind is “7”.
Once the Datapad is open you’ll see multiple hacks to pick from, however beforehand keep in mind that each hack has 1-3 layers of firewalls depending on the difficulty. Luckily we have a cheat sheet for the Tech Firewalls. The hacks are as follows

Droid Hack	The user is able to hack a singular droid in front of them to join their side. The droid will remain a member of the player's group and engage enemies until death. The user is able to hack as many droids as they want. In the event the user fails to hack a droid, the droid will short circuit and stop the heart of the hacker.	• Origin: Player • Range: Directly in front of the player
Droid Wave	The user can send out a signal in a short radius around them, causing 5 random droids to switch to their side for a short period. Once time is up, the droids will short-circuit and cease to work. In the event the user fails the hack, the droids will instead know the exact location of the hacker and run directly to their location	• Origin: Player • Range: 100 meters • Duration: 30 seconds
Droid Stop	The user can send a signal in a radius around them, causing all nearby droids to stop firing for a short period of time. Once the time is up, the droids will go back to fighting like normal. In the event the user fails the hack, the droids will learn the exact locations of the hacker and hunt them down.	• Origin: Player • Range: 100 meters • Duration: 30 seconds
Droid Flee	The user can send out a signal in a short radius around them, causing nearby droids to flee away from the hacker for a short period. Once time is up, the droids will turn around and fight like normal. In the event the user fails the hack, the droids will learn the exact locations of the hacker and hunt them down.	• Origin: Player • Range: 100 meters • Duration: Until they reach 100 meters from the target.
Droid Disrupt	The user is able to send out a signal in a short radius around them, causing all nearby droids' accuracy to drop significantly for a short period of time. Once time is up, droids will be able to act normally. In the event the user fails the hack, The droids will instead receive a large boost in skill.	• Origin: Player • Range: 100 meters • Duration: 30 seconds
Mine disable	The user is able to send out a signal to all mines in a radius around them, temporarily disabling the mines and allowing the user to move through them without damage. Once time is up the mines will be reactivated. In the event the user fails the hack, random mines in the mine field will blow up instantly	• Origin: Player • Range: 100 meters • Duration: 2 Minutes
Hack Remote	The user is able to hack a singular droid nearby and take direct control of the droid. If the droid were to shoot their gun, they will become hostile to other	• Origin: Player • Range: 100 meters • Duration: 90 Seconds

	droids. In the event the user fails to hack a droid, the droid will short circuit and stop the heart of the hacker.	

- **Computer Spike**

The computer spike features a more simplified version of hacking which requires less practice however its abilities are significantly reduced. The computer spike is only able to hack objects for intel and additional objects designated by mission makers.

The computer spike features a “Skyrim” style lockpicking minigame where the player will rotate the computer spike around in search for the correct angle to fully complete the hack. The user will then rotate the dial to attempt the current orientation. The amount that the dial rotates depends on how close the player is to the correct angle.

By default, to turn the computer spike the user can use “A” and “D” and to rotate the dial the user can hold “S”. This can be configured in control settings.
